

Best practice central heating system maintenance

A simple four step process for best practice system protection

- 1. Cleanse** - We use ADEY *MC5 RapidFlush* chemical cleanser in the system to loosen any sludge which may have built up over time
- 2. Flush** - using ADEY *MagnaCleanse* we quickly and efficiently cleanse your central heating system removing virtually all of the suspended sludge on the first go.
- 3. Maintain** - We install an ADEY *MagnaClean* filter on all new central heating systems to ensure ongoing maintenance and protection
- 4. Protect** - And finally we add a chemical inhibitor, ADEY's *MC1+* to the system water to maintain the quality of the water in your central heating system and protect from further sludge build up.
